FIKE INTRODUCES FIRE SUPPRESSION SYSTEM USING
3M™ NOVEC™ 1230 FIRE PROTECTION FLUID

In keeping with our mission to protect life and critical assets, Fike Corporation is proud to announce the addition of 3M™ Novec™ 1230 Fire Protection Fluid to its line of clean agent fire suppression systems equipped with Fike® Impulse® Valve Technology.

Designed to minimize damage to critical assets when suppressing fire, the system is suitable for use in data centers, control rooms, museums and a range of other spaces containing items that would easily be damaged by traditional fire suppression methods, such as a sprinkler system.

This system has zero ozone depleting potential, as well as a global warming potential of less than one, making it an environmentally friendly fire safety solution.

The Fike system using Novec 1230 fluid is the only system that offers both the reliability and efficiency of Fike’s patented rupture-disc-based Impulse Valve, and the environmental and fire extinguishing benefits of Novec 1230 fluid.

Product certification training is available online to Fike distributors currently certified on one of Fike’s other chemical agent systems. In-person training will also be offered. Please visit Fike’s Customer portal at portal.fike.com for more information.

With the addition of Novec 1230 fluid, Fike distributors now have access to the industry’s most comprehensive line of fixed fire extinguishing systems. To learn more, contact your Fike regional manager, or email novec@fike.com.

Sincerely,

Jason D. Jones
Global Product Manager
